

BYBIT - OKX - BLOFIN * SEQUENCE

For outside the EU, spot and derivatives. Bybit Global first, then OKX, then Blofin for derivatives only.

Published by the Just B Free Family, step by step in plain language.

NEW AND EXCLUSIVE FOR OUR COMMUNITY

Sign up through our Sequence link: **no onboarding fee** and **25% performance fee** in your first year instead of the standard 33%.

tradewithsequence.com/?ref=0x059_visser_pari_passu

Important: this only works through this link. If you sign up with Google or without our code, you are stuck on 33%, with no way back.

THE STRATEGIES

EVERY STRATEGY, ONE ACCOUNT

Sequence trades automatically on your own Bybit account, through an API key without withdrawal rights. Your coins stay yours and you can stop at any time. On Bybit Global you can run every Sequence strategy. The two most used:

	USD/ALT · THE SPOT BOT	BTC INVERSE
Market	Spot, no leverage	Inverse perpetual, with leverage
You hold	USDT (preferred) or USDC	BTC (margin preferably in USDT)
Profits in	USD (stablecoin)	BTC, you collect more bitcoin
Trades	DOGE against your USDT	BTC perpetual
Minimum	40,000 USD	0.4 BTC
Variants	one	1x (standard) or 1.5x (advanced)
Risk	No liquidation risk	Higher, leverage and margin
For whom	A calm start, profits in dollars	Collecting more bitcoin

See all strategies on the [Sequence wiki](#). Every strategy needs movement to close larger trades. In quiet markets you see smaller trades, which is normal. This is a long term approach, not day trading.

THE RISKS OF TRADING

Trading always carries risk, even when a bot does it for you. These are the main ones:

- **Market.** The crypto market can move fast, so swings are fairly normal.
- **Technology.** An outage or broken connection can miss or delay a trade.
- **Strategy.** What worked in the past is no guarantee for the future.

So never trade yourself on the bot's sub-account, only invest what you can afford to lose, and always do your own research.

WHY BYBIT GLOBAL

OUTSIDE THE EU: WHICH EXCHANGE?

IN THIS ORDER	WHAT YOU CAN RUN
1. Bybit Global	Our first choice. Every Sequence strategy, spot and derivatives, and the exchange Sequence prefers for the spot bot
2. OKX	Also works outside the EU, spot and derivatives
3. Blofin	Only the derivatives strategies, such as BTC Inverse

The steps in this guide follow Bybit. On OKX and Blofin they are almost the same, OKX also asks you to set a passphrase for your API key. Living in the EU? Use our OKX guide.

PREPARATION

WHAT DO YOU NEED BEFORE YOU START?

- A working email address and a password manager, for example 1Password or Bitwarden
- A phone for 2FA, with Google Authenticator or Authy
- Capital: at least 40,000 USD in USDT (spot bot) or 0.4 BTC (BTC Inverse)
- About 30 minutes of undisturbed time

READ THIS FIRST

Only do this with money you can afford to lose, and start only once you understand what the bot does. Torn between strategies? Start with the spot bot. Questions about Sequence go to their support: support@tradewithsequence.com.

STEP BY STEP

SIGNING UP AND SETTING UP

1 Sign up with Sequence, through our link

Only through this link do you get the community deal: no onboarding fee and 25% fee in the first year:

tradewithsequence.com/?ref=0x059_visser_pari_passu

- Click Sign Up and enter your email address and a strong password
- Confirm your email, and check your spam folder too
- Turn on 2FA right away through Settings, Security, Enable 2FA

2 Create your Bybit Global account

Already have a funded account? Skip this step. No account yet? Sign up through our link, it supports JBF:

1. Bybit Global, every strategy: partner.bybit.com/b/50352
2. OKX, spot and derivatives: okx.com/join/JUSTBFREEFAMILY
3. Blofin, derivatives only: partner.blofin.com/d/JustBFree

- Register with your email and a strong password, then turn on 2FA
- Complete verification by uploading your passport or ID, about 5 minutes of work
- Deposit your capital, by card or bank transfer where that is available in your country, or crypto from another exchange or wallet
- Then convert it: to USDT for the spot bot, to BTC or USDT for BTC Inverse
- Sending crypto? Always pick the right network. BTC uses the bitcoin network, USDT usually TRC20 or ERC20. The wrong network means your funds are gone

3 Create a sub-account for the bot

This keeps your bot funds separate from your own trading. Strongly recommended, and one sub-account per strategy is cleanest.

- Go to your account menu, Subaccount, Create Subaccount
- Give it a name, for example Sequence-Spot or Sequence-Inverse
- Transfer your funds from your main account to this sub-account
- Check that the balance is correct before you continue

STEP BY STEP

CONNECTING AND STARTING

Always work from the [getting started guide on the Sequence wiki](#). Sequence can change things there, such as the settings for your API key. Keep this guide next to it as a reference. In broad lines, this is what you will do:

4 Create an API key on Bybit

- Log in to your sub-account first
- Go to API Management, Create New Key, and choose the option to connect to a third-party application
- Name it Sequence and give it read and trade permissions for the strategy you pick. **Never tick Withdraw**
- Add the Sequence IP addresses, you find them in their docs. A key bound to IP addresses also stays valid, while a key without IPs expires after three months
- Save your API Key and Secret in your password manager right away, the Secret is shown only once

5 Connect Bybit to Sequence

- In your Sequence dashboard go to Exchanges, Add Exchange, Bybit
- Paste your API Key and Secret
- Click Test Connection, a green check means it worked
- Click Save

6 Activate the strategy

- Go to Strategies and pick **USD/ALT** (spot bot), **BTC Inverse** or another strategy from the wiki
- Click Start Strategy and choose Bybit
- Spot bot: capital at least 40,000 USD
- BTC Inverse: start with variant **1x**. Market setting **Bull** in an uptrend (50% safety net), **Bear** in a correction phase (61% safety net). Capital at least 0.4 BTC, margin 100% preferably in USDT
- Click Confirm, the status turns to Active

GOLDEN RULE

A bot never gets withdrawal rights. Sequence trades for you, nothing more. If you ever see an instruction telling you to tick withdraw, stop and contact Sequence support.

AFTER ACTIVATION

WHAT DOES THE BOT DO NOW?

- Places orders using DCA logic as soon as conditions line up
- Runs 24/7 in the background, you do not have to do anything
- In quiet markets: smaller and fewer trades, which is normal
- In volatile markets the strategy comes into its own
- Spot bot: profits in USD. BTC Inverse: profits in BTC

MAINTENANCE, KEPT SIMPLE

WHEN	WHAT
Once a week	Check your Sequence dashboard for your result and open orders
Once a month	Check your balance and open positions on Bybit
On a big market shift	BTC Inverse: consider switching between Bull and Bear mode. Check the Sequence wiki for their advice

NON-NEGOTIABLE

- 2FA on for both accounts
- No withdrawal rights on the API key
- API key bound to the Sequence IP addresses
- Use a password manager, not notes on paper
- Never share your keys, not even with someone claiming to be support

QUESTIONS OR PROBLEMS?

For anything about your account, the connection, the strategy or your fee, **Sequence support** is the right place:

support@tradewithsequence.com

SECURITY

STAYING SAFE

Your account, your keys. These steps make life as hard as possible for scammers.

Turn these on in Bybit

- **Anti-phishing code.** Set your own code. It then appears in every genuine Bybit email. If it is missing, the email is fake
- **Withdrawal address whitelist.** Funds can only go to addresses you approved in advance
- **2FA with an app,** such as Google Authenticator or Authy. Not by SMS, which can be intercepted

Spot the scams

- Sequence, Bybit and Just B Free Family will **never** ask for your API keys, password or seed phrase
- None of us will ever send you a private message with a link first. Scammers often pose as well-known names
- Only use the links in this guide, and check the web address before you log in

Keep track of your keys

- Now and then, check your API overview on Bybit for keys you do not recognise, and delete them straight away
- Stopping the bot? Delete the API key as well

For the long term: self-custody

- Bitcoin you want to keep for the long term and are not using for the bot can be kept in self-custody on a hardware wallet. Then you hold the keys, be your own bank
- [Tangem](#), 10% off with code HKVN4E · [BitBox02](#), 5% off with code JUSTBFREE
